#### REVERSE-ENGINEERING MALWARE

The shortcuts and tips behind this cheat sheet are covered in Lenny Zeltser's SANS Institute course SEC610: Reverse-Engineering Malware; for details see http://zeltser.com/reverse-malware.

## General Approach

- 1. Set up a controlled, isolated laboratory in which to examine the malware specimen.
- 2. Perform behavioral analysis to examine the specimen's interactions with its environment.
- 3. Perform static code analysis to further understand the specimen's inner-workings.
- 4. Perform dynamic code analysis to understand the more difficult aspects of the code.
- 5. If necessary, unpack the specimen.
- 6. Repeat steps 2, 3, and 4 (order may vary) until analysis objectives are met.
- 7. Document findings and clean-up the laboratory for future analysis.

### **Behavioral Analysis**

Be ready to revert to good state via dd, VMware snapshots, CoreRestore, Ghost, SteadyState, etc.

Monitor local (Process Monitor, Process Explorer) and network (Wireshark, tcpdump) interactions.

Detect major local changes (RegShot, Autoruns).

Redirect network traffic (hosts file, DNS, Honeyd).

Activate services (IRC, HTTP, SMTP, etc.) as needed to evoke new behavior from the specimen.

## IDA Pro for Static Code Analysis

Text search	Alt+T
Show strings window	Shift+F12
Show operand as hex value	Q
Insert comment	:
Follow jump or call in view	Enter
Return to previous view	Esc

Go to next view	Ctrl+Enter
Show names window	Shift+F4
Display function's flow chart	F12
Display graph of function calls	Ctrl+F12
Go to program's entry point	Ctrl+E
Go to specific address	G
Rename a variable or function	N
Show listing of names	Ctrl+L
Display listing of segments	Ctrl+S
Show cross-references Select to selected function	function name » Ctrl+X
Show stack of current function	Ctrl+K

Olly Dha for Dynamic Code Analy

OllyDbg for Dynamic C	OllyDbg for Dynamic Code Analysis	
Step into instruction	F7	
Step over instruction	F8	
Execute till next breakpoint	F9	
Execute till next return	Ctrl+F9	
Show previous/next execut	ed instruction - / +	
Return to previous view	*	
Show memory map	Alt+M	
Follow expression in view	Ctrl+G	
Insert comment	;	
Follow jump or call in view	Enter	
Show listing of names	Ctrl+N	
New binary search	Ctrl+B	
Next binary search result	Ctrl+L	
Show listing of software breakpoints Alt+B		
Assemble instruction in place of selected one	Select instruction » Spacebar	
Edit data in memory or instruction opcode	Select data or instruction » Ctrl+E	
Show SEH chain	View » SEH chain	

Show patches Ctrl+P

# Bypassing Malware Defenses

To try unpacking quickly, infect the system and dump from memory via LordPE or OllyDump.

For more surgical unpacking, locate the Original Entry Point (OEP) after the unpacker executes.

If cannot unpack cleanly, examine the packed specimen via dynamic code analysis while it runs.

When unpacking in OllyDbg, try SFX (bytewise) and OllyDump's "Find OEP by Section Hop".

Conceal OllyDbg via HideOD and OllyAdvanced.

A JMP or CALL to EAX may indicate the OEP, possibly preceded by POPA or POPAD.

Look out for tricky jumps via SEH, RET, CALL, etc.

If the packer uses SEH, anticipate OEP by tracking stack areas used to store the packers' handlers.

Decode protected data by examining results of the decoding function via dynamic code analysis.

Correct PE header problems with XPELister, LordPE, ImpREC, PEiD, etc.

To get closer to OEP, try breaking on unpacker's calls to LoadLibraryA or GetProcAddress.

#### Common x86 Registers and Uses EAX Addition, multiplication, function results ECX Counter Base for referencing function arguments EBP (EBP+value) and local variables (EBPvalue) Points to the current "top" of the stack; **FSP** changes via PUSH, POP, and others EIP Points to the next instruction Contains flags that store outcomes of **EFLAGS** computations (e.g., Zero and Carry flags)
